**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

## INTRODUCTION

- There is an increasing awareness of the public on environmental issues
- Expert knowledge is often required to understand them
  - **A need for simple and understandable tools to explain environmental issues**
- Games provide a virtual world with given boundaries (rules) that the player needs to understand and to follow to win
- Furthermore, games are dynamic and interactive: the player engagement and its knowledge retention increase
  - **Games display interesting features to spread scientific thinking<sup>1</sup>**

## OBJECTIVE

### TO DEVELOP A BOARD GAME AND A COMPUTER-BASED GAME TO EXPLAIN THE BASIC CONCEPTS OF AQUATIC ECOLOGY

The games aim to be **complementary**:

- in term of **player interactions** and **system dynamics**
- in the **targeted players** (groups vs isolated gamers)

## METHODOLOGY

STEP 1  
STEP 2  
STEP 3  
STEP 4

### CONTEXT

- Aim of the games
- Aquatic species and ecological concepts
- Inclusion of time and chance

### PROTOTYPES

- Design of the games (players, token, board)
- Size and layout of the board
- Coding and calibration of the model

### TEST AND EVALUATION

- Gather player feedbacks
- Refining and adapting the games

### DIFFUSION

- Identification of funding opportunities
- Construction of a diffusion network

## BOARD GAME

### DEVELOPMENT OF THE PROTOTYPE

#### Context

- The **player is a fish**, either a predator or a prey
- The **objective** of the game is to **reach a stable population of fish**
- Concepts illustrated: **feeding strategy, reproduction, predation and competition**

#### Basis of the board game

- **Species**: the **roach** (*Rutilus rutilus*) as a prey and the **pumpkinseed** (*Lepomis gibbosus*) as a predator, two **common european small fish**
- Illustration of a **native european shoal fish** (the roach) and of an **invasive species** (the pumpkinseed) with **specific life history** characteristics

### HOW TO PLAY THE GAME

- The board represents the **edge of a lake** with **plants, crustaceans, and mollusks**
- The player choses a fish species and starts the game with 2 token (male+female)
- The players **use dices** to **move the tokens** on the board and to **find ressources**
- Each ressource provides the fish with a **given amount of energy** that he accumulates
- This energy can further **be used to reproduce** (adult fish), to **grow** (juvenile) or to **attack** a prey (predator)
- Each turn, the player takes a **card « chance »** representing the **events impacting the lake**

#### Ecological characteristics of each player:

##### PLAYER 1: PREY

The roach

##### PLAYER 2: PREDATOR

The pumpkinseed

#### RESSOURCES

Crustaceans and mollusks

#### REPRODUCTION

The eggs stick to the plants

#### PREDATION

#### COMPETITION

The eggs are layed in a nest done by the male

#### EXAMPLE OF « CHANCE » CARD

A solitary pike is swimming around... Watch out! You just lost one fish

Tonight is full moon. You see as well as in day light: play again

The forestry guards cut trees near the lake: plants become much more light! Snails eat more: they bring twice more energy for 2 turns

A fisherman put his boat onto the water. He repainted it with antifouling: no mollusk for 2 turns

Opening of a fishing contest. The introduced fish destroyed the whole bottom of the lake: no more ressources in the area for 2 turns

## COMPUTER-BASED GAME

### DEVELOPMENT OF THE PROTOTYPE

#### Context

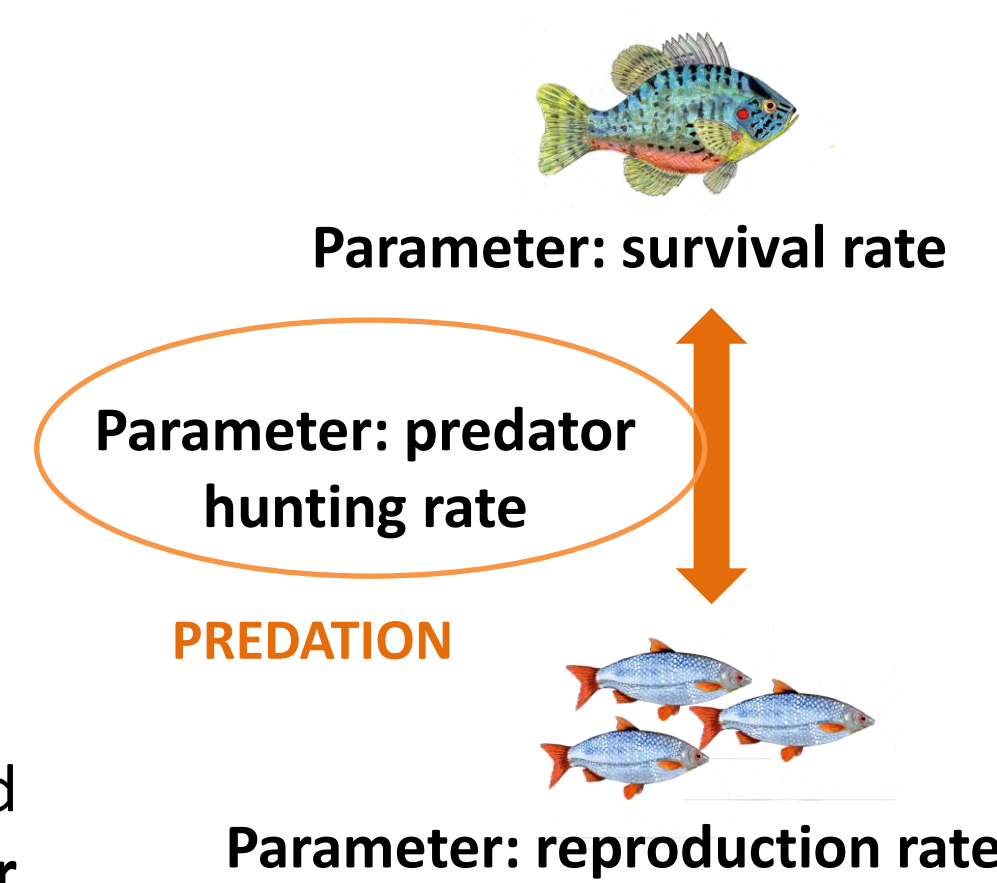

- The **player controls an ecosystem** with **preys** (the roach) and **predators** (the pumpkinseed)
- The **objective** of the game is to **maintain the stability of the ecosystem**
- Concepts illustrated: **population dynamic** and **ecosystem resilience**

#### Basis of the computer-based game:

- An **agent-based model<sup>2</sup>** (ABM) for a simple prey-predator system is proposed as a basis of the computer game (Netlogo software)
- ABM **simulate the behavior and interactions between agents** (fish) to reconstruct the **population dynamic** (bottom-up approach)
- **Stochasticity** is included with spatialized interactions (smoothed brownian motions), illustrating the **randomisation of prey-predator interactions**

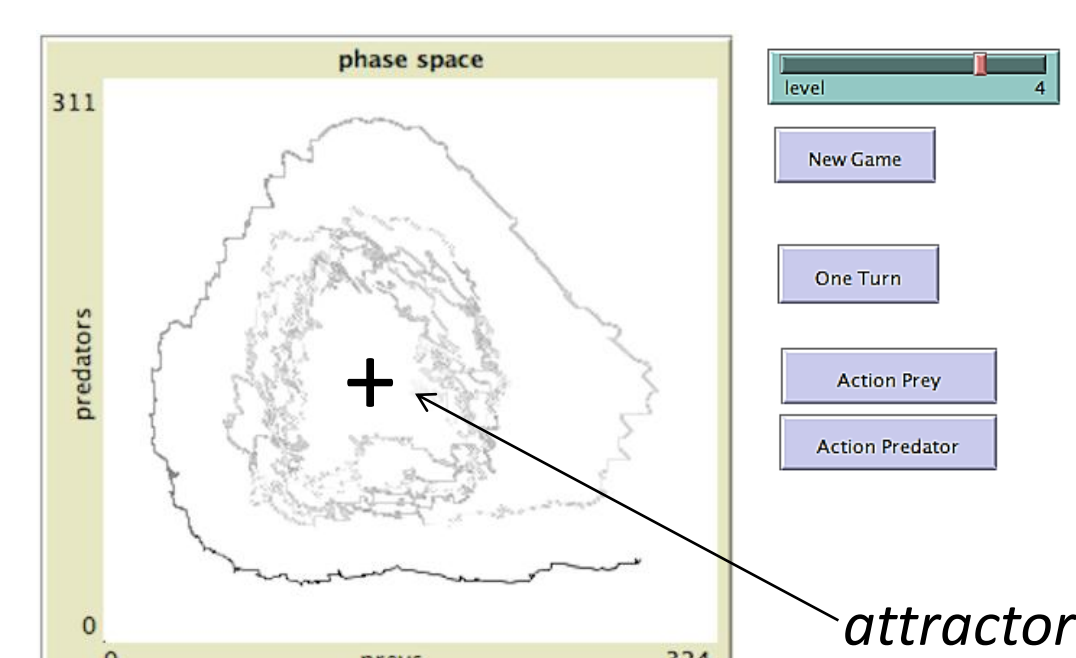

#### Model calibration:

- **Systematic exploration of parameter space** using OpenMole software<sup>3</sup>, to verify theoretical average trajectories in phase space, which allows analytical and numerical determination of initial position (**attractor**) and justify the use of this system for the game. The figures show **estimated average trajectories** for two points in parameter space.

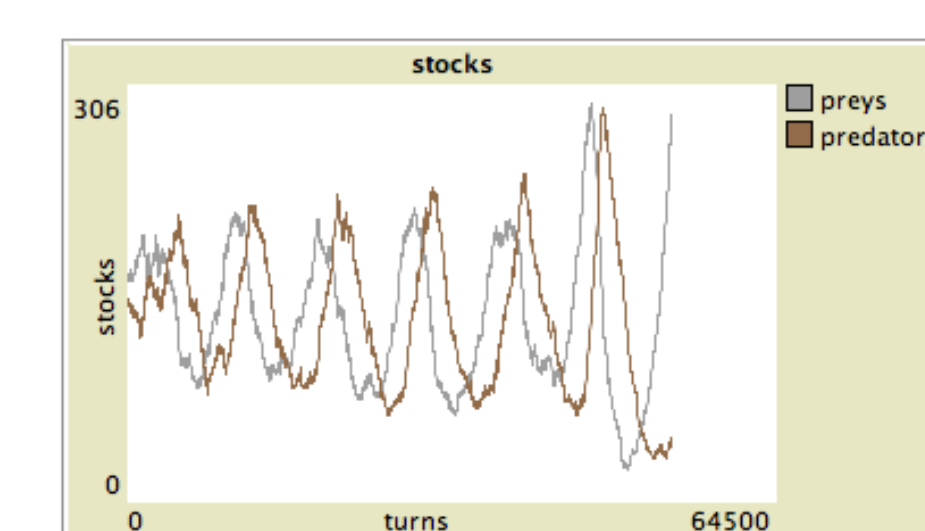

### HOW TO PLAY THE GAME

- The player starts the game with a **stable ecosystem**: the **initial position** is the **attractor**
- The button « **one turn** » makes the ecosystem evolve during **50 time steps**
- The player **sees the changes** in the fish populations **simultaneously on the screen**
- The **trajectory can be corrected** towards the attractor in the **phase space** by **changing the parameters** of the model (predator survival, prey reproduction and hunting behavior)
- **External events randomly perturbate the ecosystem**
- The game includes **5 levels of difficulty** based on **event strength**

Phase space figuring in Y axis the predators and in X axis the preys (Netlogo interface)

The stock: representation of the oscillations in fish populations (Netlogo interface)

The ecosystem: representation of the fish populations (Netlogo interface)

- Open source: code available at <https://github.com/JusteRaimbault/MediationEcotox>

## DISCUSSION

- ✓ Demonstration of the **proof-of-concept**: the **prototypes** are available for testing
- ✓ Both game are **complementary** as they integrate different time scales and illustrate diverse basic concepts of aquatic ecology
- ✓ **No knowledge in aquatic ecology is needed to play both games**: wide possibilities in targeted audiences
- ✓ The methodology is **flexible** and **adaptable**:
  - **On-going development** of the games
  - **Refinements** and changes are **easy to integrate** in new versions of the games

## PERSPECTIVES

### Short term perspectives:

- **Next step** of the project: **test the games and gather player feedbacks** → do players like the games?
- **Identification of potential players** (children, school/university, family, adults...) and **adaptation of the games** accordingly (simplification/complexification)

### Long term perspectives:

- **Potential uses** of the games as **educational tools** (with educative support) or **sensibilisation tools** (e.g. adapting the species and perturbations)
- **Funding** and **diffusion** of the **board game** through **crowdfunding platforms** and **game festivals**
- **Diffusion** of the **computer-based game**: open online access through **Netlogoweb** and development of **mobile applications**
